Question 1

- If we open a file (this implies the library is included and an actual command to open a file has been issued), there are two things we need to be sure to do. What are they?

Question 1

- If we open a file (this implies the library is included and an actual command to open a file has been issued), there are two things we need to be sure to do. What are they?
- Make sure we opened the file & close it when we're done

Question 2, True or False

- When writing to or reading from a file, the data type of the stream is the same.

Question 2, True or False

- When writing to or reading from a file, the data type of the stream is the same.
- FALSE

Question 2, True or False

- When writing to or reading from a file, the data type of the stream is the same.
- FALSE
- A pointer holds a memory address, which is an integer. Therefore, a pointer can be treated like an integer.

Question 2, True or False

- When writing to or reading from a file, the data type of the stream is the same.
 - FALSE
-
- A pointer holds a memory address, which is an integer. Therefore, a pointer can be treated like an integer.
 - FALSE

Question 3

- Say I want to display numbers in a non-scientific format with 4 decimal places. Which set of commands do I include in my program?

Question 3

- Say I want to display numbers in a non-scientific format with 4 decimal places. Which set of commands do I include in my program?
- `cout.setf(ios::fixed);`
`cout.setf(ios::showpoint);`
`cout.precision(4);`

This was option (d)

Question 4

- The cout member function `setf()` stands for 'set flag.' If I wish to reverse a flag setting, what function do I call?

Question 4

- The cout member function `setf()` stands for 'set flag.' If I wish to reverse a flag setting, what function do I call?
- `unsetf()`

Question 5

- Consider the following function prototype.

```
// Multiplies x and y and returns the product  
int multiply(int x, int y = 2);
```

What values will be returned by the following function calls, respectively?

```
product = multiply(3, 7);  
product = multiply(3);
```

Question 5

- Consider the following function prototype.

// Multiplies x and y and returns the product

```
int multiply(int x, int y = 2);
```

What values will be returned by the following function calls, respectively?

```
product = multiply(3, 7);
```

```
product = multiply(3);
```

- 21, 6

This was option (b)

Question 6

- Given the following declaration:

```
double voltage = 9.113;
```

Declare a pointer that is initialized to point to voltage.

Question 6

- Given the following declaration:

```
double voltage = 9.113;
```

Declare a pointer that is initialized to point to voltage.

- `double *ptr = &voltage;`

Question 7

- Using the pointer defined above, change the value of `voltage` to 5.776.

Question 7

- Using the pointer defined above, change the value of `voltage` to 5.776.
- `*ptr = 5.776;`
